Hierarchy
(Flexible)

Summary

Staff Salary Processing:
Problem Statement: RECAP (Module 29)

- An organization needs to develop a salary processing application for its staff

- At present it has an engineering division only where Engineers and Managers work. Every Engineer reports to some Manager. Every Manager can also work like an Engineer

- The logic for processing salary for Engineers and Managers are different as they have different salary heads

- In future, it may add Directors to the team. Then every Manager will report to some Director. Every Director could also work like a Manager

- The logic for processing salary for Directors will also be distinct

- Further, in future it may open other divisions, like Sales division, and expand the workforce

- **Make a suitable extensible design**

Summary

C Solution:
Engineer + Manager: RECAP (Module 29)

- How to represent Engineers and Managers?
  - `struct`
- How to initialize objects?
  - Initialization functions
- How to have a collection of mixed objects?
  - Array of `union`
- How to model variations in salary processing algorithms?
  - `struct`-specific functions
- How to invoke the correct algorithm for a correct employee type?
  - Function switch
  - Function pointers

Summary

C++ Solution: Non-Polymorphic Hierarchy Engineer + Manager

- How to represent Engineers and Managers?
  - Non-Polymorphic `class` hierarchy
- How to initialize objects?
  - Constructor / Destructor
- How to have a collection of mixed objects?
  - `array` of base class pointers
- How to model variations in salary processing algorithms?
  - Member functions
- How to invoke the correct algorithm for a correct employee type?
  - Function switch
  - Function pointers

```cpp
#include <iostream>
#include <string>
using namespace std;

typedef enum E_TYPE { Er, Mgr };
class Engineer { protected: string name_; E_TYPE type_;
public: Engineer(const string& name, E_TYPE e = Er) : name_(name), type_(e) {}
    E_TYPE GetType() { return type_; }
    void ProcessSalary() { cout << name_ << ": Process Salary for Engineer" << endl; }
};
class Manager : public Engineer { Engineer *reports_[10];
public: Manager(const string& name, E_TYPE e = Mgr) : Engineer(name, e) {}
    void ProcessSalary() { cout << name_ << ": Process Salary for Manager" << endl; }
};
int main() { Engineer e1("Rohit"), e2("Kavita"), e3("Shambhu");
    Manager m1("Kamala"), m2("Rajib");
    Engineer *staff[] = { &e1, &m1, &m2, &e2, &e3 };

    for (int i = 0; i < sizeof(staff) / sizeof(Engineer*); ++i) {
        E_TYPE t = staff[i]->GetType();
        if (t == Er) staff[i]->ProcessSalary();
        else if (t == Mgr) ((Manager *)staff[i])->ProcessSalary();
        else cout << "Invalid Staff Type" << endl;
    }
    return 0;
}
```

Summary

C++ Solution: Polymorphic Hierarchy (Flexible)
Engineer + Manager + Director + Others

- How to represent Engineers, Managers, Directors, etc.?
    - Polymorphic `class` hierarchy with an Abstract Base Employee
- How to initialize objects?
    - Constructor / Destructor
- How to have a collection of mixed objects?
    - `array` of base class pointers
- How to model variations in salary processing algorithms?
    - Member functions
- How to invoke the correct algorithm for a correct employee type?
    - Virtual Functions (Pure in Employee)
