Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators

static_cast
reinterpret_cast

Summary

Module Objectives

- Understand casting in C and C++

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators

static_cast
reinterpret_cast

Summary

Module Outline

- Casting: C-Style: RECAP
  - Upcast & Downcast
- Cast Operators in C++
  - const_cast Operator
  - static_cast Operator
  - reinterpret_cast Operator
  - dynamic_cast Operator
- typeid Operator

Casting in C and C++

Module 33

Partha Pratim Das

Objectives & Outline

Cast Operators

static_cast

reinterpret_cast

Summary

- Casting in C
  - Implicit cast
  - Explicit C-Style cast
  - Loses type information in several contexts
  - Lacks clarity of semantics
- Casting in C++
  - Performs fresh inference of types without change of value
  - Performs fresh inference of types with change of value
    - Using implicit computation
    - Using explicit (user-defined) computation
  - Preserves type information in all contexts
  - Provides clear semantics through cast operators:
    - const_cast
    - static_cast
    - reinterpret_cast
    - dynamic_cast
  - Cast operators can be grep-ed in source
  - C-Style cast must be avoided in C++

`static_cast` Operator

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators
static_cast
reinterpret_cast

Summary

- `static_cast` performs all conversions allowed implicitly (not only those with pointers to classes), and also the opposite of these. It can:
  - Convert from `void*` to any pointer type
  - Convert integers, floating-point values and `enum` types to `enum` types

- `static_cast` can perform conversions between pointers to related classes:
  - Not only up-casts, but also down-casts
  - No checks are performed during run-time to guarantee that the object being converted is in fact a full object of the destination type

- Additionally, `static_cast` can also perform the following:
  - Explicitly call a single-argument constructor or a conversion operator – The User-Defined Cast
  - Convert to rvalue references
  - Convert `enum class` values into integers or floating-point values
  - Convert any type to void, evaluating and discarding the value

```
#include <iostream>
using namespace std;

// Built-in Types
int main() {
    int i = 2;
    double d = 3.7;
    double *pd = &d;

    i = d;                      // implicit -- warning
    i = static_cast<int>(d);    // static_cast -- okay
    i = (int)d;                 // C-style -- okay

    d = i;                      // implicit -- okay
    d = static_cast<double>(i); // static_cast -- okay
    d = (double)i;              // C-style -- okay

    i = pd;                     // implicit -- error
    i = static_cast<int>(pd);   // static_cast -- error
    i = (int)pd;                // C-style -- okay:     RISKY: Should use reinterpret_cast

    return 0;
}
```

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators

static_cast
reinterpret_cast

Summary

```
#include <iostream>
using namespace std;

// Class Hierarchy
class A { };
class B: public A { };

int main() {
    A a;
    B b;

    // UPCAST
    A *p = &b;              // implicit -- okay
    p = static_cast<A*>(&b); // static_cast -- okay
    p = (A*)&b;             // C-style -- okay

    // DOWNCAST
    q = &a;                 // implicit -- error
    q = static_cast<B*>(&a); // static_cast -- okay: RISKY: Should use dynamic_cast
    q = (B*)&a;             // C-style -- okay

    return 0;
}
```

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators

static_cast

reinterpret_cast

Summary

`static_cast` Operator: Pitfall

```
class Window { public: virtual void onResize(); ... }
class SpecialWindow: public Window { // derived class
public:
    virtual void onResize() { // derived onResize impl;
        static_cast<Window>(*this).onResize(); // cast *this to Window,
            // then call its onResize;
            // this doesnt work!

        ... // do SpecialWindow-specific stuff
    }
    ...
};
```

Slices the object, creates a temporary and calls the method!

```
class SpecialWindow: public Window { // derived class
public:
    virtual void onResize() { // derived onResize impl;
        Window::onResize(); // Direct call works

        ... // do SpecialWindow-specific stuff
    }
    ...
};
```

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators
static_cast
reinterpret_cast

Summary

```cpp
#include <iostream>
using namespace std;

// Un-related Types
class B;
class A {
public:

};

class B { };

int main() {
    A a;
    B b;
    int i = 5;

    // B ==> A
    a = b;                     // error
    a = static_cast<A>(b);     // error
    a = (A)b;                  // error

    // int ==> A
    a = i;                     // error
    a = static_cast<A>(i);     // error
    a = (A)i;                  // error

    return 0;
}
```

```cpp
#include <iostream>
using namespace std;

// Un-related Types
class B;
class A {
public:
    A(int i = 0) { cout << "A::A(i)\n"; }
    A(const B&) { cout << "A::A(B&)\n"; }
};

class B { };

int main() {
    A a;
    B b;
    int i = 5;

    // B ==> A
    a = b;                     // Uses A::A(B&)
    a = static_cast<A>(b);     // Uses A::A(B&)
    a = (A)b;                  // Uses A::A(B&)

    // int ==> A
    a = i;                     // Uses A::A(int)
    a = static_cast<A>(i);     // Uses A::A(int)
    a = (A)i;                  // Uses A::A(int)

    return 0;
}
```

Module 33

Das

Objectives &
Outline

Cast
Operators

static_cast
reinterpret_cast

Summary

```cpp
#include <iostream>
using namespace std;

// Un-related Types
class B;
class A { int i_; public:

};
class B { public:

};
int main() {
    A a; B b; int i = 5;

    // B ==> A
    a = b;                    // error
    a = static_cast<A>(b);    // error
    a = (A)b;                 // error

    // A ==> int
    i = a;                         // error
    i = static_cast<int>(a);       // error
    i = (int)a;                    // error

    return 0;
}
```

```cpp
#include <iostream>
using namespace std;

// Un-related Types
class B;
class A { int i_; public:
    A(int i = 0) : i_(i)
    { cout << "A::A(i)\n"; }
    operator int()
    { cout << "A::operator int()\n"; return i_; }
};
class B { public:
    operator A()
    { cout << "B::operator A()\n"; return A(); }
};
int main() {
    A a; B b; int i = 5;

    // B ==> A
    a = b;                    // B::operator A()
    a = static_cast<A>(b);    // B::operator A()
    a = (A)b;                 // B::operator A()

    // A ==> int
    i = a;                         // A::operator int()
    i = static_cast<int>(a);       // A::operator int()
    i = (int)a;                    // A::operator int()

    return 0;
}
```

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators

static_cast
reinterpret_cast

Summary

reinterpret_cast Operator

- reinterpret_cast converts any pointer type to any other pointer type, even of unrelated classes
- The operation result is a simple binary copy of the value from one pointer to the other
- All pointer conversions are allowed: neither the content pointed nor the pointer type itself is checked
- It can also cast pointers to or from integer types
- The format in which this integer value represents a pointer is platform-specific
- The only guarantee is that a pointer cast to an integer type large enough to fully contain it (such as intptr_t), is guaranteed to be able to be cast back to a valid pointer
- The conversions that can be performed by reinterpret_cast but not by static_cast are low-level operations based on reinterpreting the binary representations of the types, which on most cases results in code which is system-specific, and thus non-portable

reinterpret_cast Operator

Module 33

Partha Pratim
Das

Objectives &
Outline

Cast
Operators

static_cast
reinterpret_cast

Summary

```cpp
#include <iostream>
using namespace std;

class A {};
class B {};

int main() {
    int i = 2;
    double d = 3.7;
    double *pd = &d;

    i = pd;                          // implicit -- error
    i = reinterpret_cast<int>(pd);   // reinterpret_cast -- okay
    i = (int)pd;                     // C-style -- okay
    cout << pd << " " << i << endl;

    A *pA;
    B *pB;

    pA = pB;                          // implicit -- error
    pA = reinterpret_cast<A*>(pB);    // reinterpret_cast -- okay
    pA = (A*)pB;                      // C-style -- okay

    return 0;
}
```
